Cybersecurity Incident Report: Network Traffic Analysis

Part 1: Provide a summary of the problem found in the DNS and ICMP traffic log.
The UDP protocol reveals that the request cannot be completed because of an error saying destination port is unreachable. It indicates that request for IP Address to destination did not go through DNS server because no service was listening to the receiving DNS port. This is based on the results of the network analysis, which show that the ICMP echo reply returned the error message: “UPD port 53 unreachable." The port 53 noted in the error message is used for DNS services. The most likely issue is because the request for IP did not go through the DNS server due to an unreachable receiving port.

Part 2: Explain your analysis of the data and provide at least one cause of the incident.
The incident occurs when several customers of clients reported that they were not able to access the client company website www.yummyrecipesforme.com, and saw the error “destination port unreachable” after waiting for the page to load. Port 53 is a port for DNS service. The word "unreachable" in the message indicates the UDP message requesting an IP address for the domain "www.yummyrecipesforme.com" did not go through to the DNS server because no service was listening on the receiving DNS port. The IT department will take a look at the firewall system and configurations to detect for possible malware or intrusion attacks.
